Title

Politicians, Regulators and Regulatory Governance: The Neglected Sides of the

Story**Abstract**

We offer a series of reflective insights about the state and direction of studies related to the politics of regulation. Notably we argue that the field is characterized by persisting divisions between Americanists and Europeanists. Largely focused on the actions taken by political principals, the former regularly report a substantial politicization of regulatory behaviour. Reflecting on recent developments in US politics however, we show that political influence could be overestimated in the US. Symmetrically, this same influence could be under-estimated by Europeanists, who for now have largely focused on regulators and agencies. This is notably suggested by a discussion of recent development in European politics, as revealed by contributions systematically measuring agency politicization in Western European democracies. On this basis, we identify some promising research questions and agendas for future studies on the politics of regulation.

1. Introduction

If one posits that regulation materialises through a range of intentional and direct government interventions to steer the activities of private-sector actors (see Koop & Lodge, 2015), then understanding the design, institution and monitoring of regulation by politicians should be key to reveal some of its critical purposes. This seemingly simple assumption has formed the guiding thread of a sizeable array of contributions

1
2
3 concerned with the many roles played by political actors in what is defined as
4
5
6
7 regulatory governance and regulation. Over the years, this term has gradually served
8
9
10 to encompass a growing range of different profiles, including members of government,
11
12
13 legislators, party politicians and executive leaders. The wide diversity of their activities
14
15
16 in regulation, too, was increasingly acknowledged – ranging from the forging of
17
18
19 regulatory orders and instruments to the more or less aggressive strategies politicians
20
21
22 deploy to control regulatory agencies. It is arguably in part due to this variety that many
23
24
25 scholars have considered the politics of regulation to be a standpoint through which its
26
27
28 ultimate functions were best understood. During recent decades, therefore, much has
29
30
31
32
33
34
35 been written on political-regulatory relations.

36
37
38
39
40
41 In this paper we argue that much has still to be said on the subject.¹ Indeed, what we
42
43
44
45 would like to stress is that the study of the politics of regulation is marked by persisting
46
47
48 divisions that hinder a full understanding of its contemporary appearances. Crucially,
49
50
51
52 these same divergent lines of thought could also be a source of biased or incomplete
53
54
55 estimations and inferences. We argue here that remedying these pitfalls could help to
56
57
58
59 improve our understanding of the realm of political-regulatory relations in a more
60

1
2
3 holistic manner. Perhaps even more importantly, we think that such efforts could
4
5
6
7 generate a more accurate appreciation of the interdependencies between economics
8
9
10 and politics under regulatory capitalism (Levi-Faur, 2005), a point to which we will
11
12
13
14 return.

15
16
17
18
19
20
21 The divisions we are referring to mostly stem from two divergent conceptualizations of
22
23
24 the ‘political’ in the study of the ‘politics’ of regulation – thus making the field largely
25
26
27 two-sided. In effect, the term might either refer in the literature to “the relationship
28
29
30 between electorally accountable institutions and the unelected regulators who draft
31
32
33 and enforce binding rules”; or, alternatively, to the often complex “interplay between
34
35
36 regulators and the entities they seek to govern” (Carrigan & Coglionese, 2011).
37
38
39
40
41 Crucially, these conceptualizations come with their own research questions,
42
43
44
45 approaches and methodologies – especially when each tries to locate the politics in
46
47
48 the study of regulation. While the first conceptualization tends indeed to envision it
49
50
51 essentially through the lens of what political actors (narrowly defined) do to impose
52
53
54 their preferences on regulators; the second one prefers to focus on regulators and the
55
56
57 actions they undertake to maintain or to increase their autonomy in the face of variable
58
59
60

1
2
3 political pressures – here understood to encompass the regulated as well as various
4
5
6
7 other entities, thus on the basis of a broader understanding of the political.
8
9

10
11
12
13 But there is arguably more than that in these fault lines. As shown throughout the
14
15
16
17 paper, each conceptualization is not equally distributed across the two sides of the
18
19
20 Atlantic – as they largely overlap with notable differences in terms of research
21
22
23 questions, conceptual orientations and methodologies that exist between Americanists
24
25
26 and Europeanists interested in the politics of regulation. Despite notable exceptions,
27
28
29 the former are mostly students of political institutions, focus on how politicians try to
30
31
32 design and monitor agencies through various mechanisms and devices, and rely on
33
34
35 formal modelling and econometric techniques to prove their assertions. Conversely,
36
37
38 many prominent contributions made by Europeanists came from public policy and
39
40
41 administration scholars concerned with how regulators seek to increase their political
42
43
44 autonomy in large and ‘polycentric’ regulatory regimes (Black, 2008). Authors from this
45
46
47
48 branch typically use in-depth case studies and qualitative methods to arrive at their
49
50
51
52
53
54
55 conclusions.
56
57
58
59
60

1
2
3
4 There are both disciplinary and historical conditions that explain this geographic
5
6
7 discrepancy. In the US, the politicization thesis largely stems from the neo-
8
9
10 institutionalist 'turn' observable from the 1980s onwards, which has led to a gradual
11
12
13 dominance (yet increasingly disputed) of the principal-agent framework in the
14
15
16 conceptualization of regulation, regulatory politics and regulatory policymaking (Miller,
17
18
19 2005). In Western Europe, the interest for regulators, their agencies and their
20
21
22
23
24
25
26
27
28
29
30
31

Perhaps predictably, these two lines of scholarship tend to report opposite findings.

The "principal-focus" of Americanists often depicts regulators as being in the hands of politicians, whether inside or outside the US. In stark contrast, "agency-focus" Europeanists regularly conclude that regulators are rarely completely subjected to political control, due to their overall ability to cultivate many relationships with their various audiences. This, we think, is problematic – and while we see no reason to

1
2
3
4 doubt these broad results, we think it is time to discuss their respective implications in
5
6
7 a more comparative and reflexive manner. The present paper offers some critical and
8
9
10 prospective reflections in that respect. In a nutshell, we suggest that contributions
11
12
13 informed by both conceptualizations could, due to their respective focuses, orientations
14
15
16 and methodologies, ignore a significant share of the variation they seek to explain.
17
18
19 More specifically, the paper advances a twofold argument. We first contend that
20
21
22 Americanists face the risk of overestimating the ‘politicization’ of regulators, as they
23
24
25 often neglect subsequent strategies, ability to shift and to resist political influence, or
26
27
28 even to build their own coalitions of audiences. Symmetrically, Europeanists face the
29
30
31 risk of under-estimating political influence on regulatory behaviours, as this is rarely
32
33
34 formally tested in their studies, yet when it is considered, appears significantly larger
35
36
37 than expected. To demonstrate that claim, we introduce critical landmarks and turning
38
39
40 points in the field associated both with the rise of new institutionalism in American
41
42
43 scholarship, and with the development of new regulatory governance and its
44
45
46 acknowledgement by Europeanists. Our discussion is illustrated with a mixture of
47
48
49 secondary material that allow us to shed light on blind spots, neglected sides and
50
51
52
53
54
55
56
57
58
59
60

1
2
3 points of intersection between each of these conceptualizations of the politics of
4
5
6
7 regulation.
8
9

10
11
12
13
14 The paper is structured in two sections. In Section 2 we first reflect on the evolutions
15
16
17 of American scholarship. Here much of the discussion is focused on studies influenced
18
19
20 by rational-choice institutionalism and principal-agent models, a choice that largely
21
22
23 stems from the fact that it has become a gold standard to study the politics of regulation
24
25
26 over the recent decades in the US, notably in political science (Miller, 2005) and in
27
28
29 economics (Laffont & Tirole, 1993). We first introduce the recurrent finding reported by
30
31
32 this literature, namely that regulators and regulatory agencies are heavily politicized.
33
34
35
36
37

38 Then we discuss the possibility of a more nuanced account by reflecting on the politics
39
40
41 of regulation under President Trump's disruptive administration, building on secondary
42
43
44 data and on the already abundant empirical literature dedicated to this question.
45
46
47

48 Organized in a similar fashion, Section 3 is devoted to a critical discussion of
49
50
51 contributions made by Europeanists and their focus on the conditions for regulatory
52
53
54 autonomy. Here we more specifically discuss a series of contributions focused on
55
56
57 independent regulatory agencies of Western Europe – entities that have attracted
58
59
60

1
2
3 much of scholarly attention in European political research over the recent decades.
4
5

6
7 We then show that these contributions may underestimate political influence, on the
8
9
10 basis of a discussion of recent findings reported by studies on agency design and their
11
12
13 termination in Western European democracies. By systematically measuring political
14
15
16 involvement and influence, these contributions suggest that agency politicization in
17
18
19 Europe could be greater than previously expected.
20
21
22
23
24
25
26
27

28 The findings that emerge from the discussions of recent empirical contributions in both
29
30 sections, aimed at illustrating the value added at factoring regulatory behaviour on one
31
32
33 hand and political influence on the other, are arguably not concluding debates on the
34
35
36 politics of regulation. What they more surely do nevertheless is to help identify future
37
38
39 research agendas for the study of political-regulatory relationships. At the end of each
40
41
42
43
44 section these agendas are presented and we return to them in our conclusion.

52 **2. The Regulatory Politics That Principals Make**

53
54
55
56
57
58

59 **2.1 Americanists and the politicization of the regulatory order**

60

1
2
3
4
5
6
7 Starting a critical discussion of the literature concerning the politics of regulation with
8
9
10 a reflection on the state of American scholarship is an inevitable choice. It is in effect
11
12
13 in this country that the field largely originated and developed during the 1980s, with a
14
15
16 number of seminal contributions still shaping current debates. Thanks to these works,
17
18
19 the politics of regulation rapidly became a rich area of enquiry for students of political
20
21
22 science, political economy and administrative law – and two decades later,
23
24
25 Europeanists learned about the topic and its relevance from Americanists (Pollack,
26
27
28
29
30
31 2002).

32
33
34
35
36
37
38 This early interest in the politics of regulation in the US arises from the reconfiguration
39
40
41 of several disciplines. At the beginning of the 1980s, scholarly interest for the politics
42
43
44 of regulation was rather scant. Notable exceptions include Stigler's seminal article on
45
46
47 regulatory capture (Stigler, 1971) – though arguably it touches more upon interest
48
49
50 group politics than the politics of regulatory decision-making per se. Other important
51
52
53 contributions include Wilson's collection featuring case-studies on regulatory entities
54
55
56 or programmes in the US (Wilson, 1980) and Mitnick's ambitious attempt at reviewing
57
58
59
60

1
2
3 the rationales for regulation and to account for its operations and removal (Mitnick,
4
5
6
7 1980). However, there was a large consensus at that time that the topic was of
8
9
10 relatively little importance for its own sake. The main reason was a widespread
11
12
13 consensus in political research according to which the growth of the administrative
14
15
16 state since the Great Depression gradually resulted in a loss of Congressional
17
18
19 influence over the newly created domains of governmental intervention and regulation.
20
21
22
23
24 In turn, this situation favoured a range of factional and special interests and, ultimately,
25
26
27 a sort of “interest groups liberalism” (Lowi, 1979). According to this conception, the
28
29
30 politics of regulation thus hardly differed from a purely distributive game involving
31
32
33
34
35 various groups seeking government support.
36
37
38
39
40

41
42 From the early 1980s onward, a new generation of scholars started to critically re-
43
44
45 examine this broad brushstroke depiction. Most of them were students of American
46
47
48 politics and political institutions, particularly of the legislative branch. Meanwhile,
49
50
51 legislative studies were indeed experiencing an important shift towards rational choice
52
53
54 institutionalism (Benoît and Rozenberg, 2020). While the study of Congress and
55
56
57 Congressional behaviour was until then largely influenced by “structure-free” economic
58
59
60

1
2
3 models of majority rule, a number of contributions developed subtler mathematical
4
5
6 conceptualizations intended to reflect the many institutional features, arrangements
7
8
9
10 and procedures said to govern legislatures (Shepsle & Weingast, 1994). It is in this
11
12
13 broad context that the study of political-regulatory relations significantly increased in
14
15
16 legislative studies. The growing reliance of the field on principal-agent models played
17
18
19 a crucial role in this change. As in other domains where it is applied, this approach
20
21
22 envisions the relation between legislators and regulatory agencies (or possibly any
23
24
25 other kind of enforcers of regulatory provisions) as one where both actors are deprived
26
27
28 of something that is possessed by the other. Political principals in Congress are indeed
29
30
31 tasked with deciding laws and regulations without being able to implement them;
32
33
34
35 meanwhile, regulators are tasked with executing laws and regulations without being
36
37
38 able to decide them. Such a “mismatch of incentives and capabilities” (Fiorina, 1979)
39
40
41
42 leaves formal authority to politicians while conferring discretion to regulators, whose
43
44
45 actions can potentially impact the payoffs for both players. This would be particularly
46
47
48 crucial in the US context, where regulation-making powers are susceptible to be
49
50
51 delegated to agencies, thus possibly reinforcing the mismatch between changing
52
53
54
55 Congressional goals and regulatory decisions (an issue that for long manifested
56
57
58
59
60

1
2
3 differently in European settings, as discussed in the next section). As a consequence
4
5
6
7 of both disciplinary reconfiguring and the institutional features of regulation in the US,
8
9
10 how political principals try to mitigate the so-called “agency loss” resulting from
11
12
13
14 delegation became a significant matter of concern for students of Congress and then,
15
16
17 of the politics of regulation.
18
19
20
21
22
23

24 These early developments are associated with a complete reconsideration of the
25
26
27 “Congressional abdication” thesis that prevailed in the 1970s (Kiewet & McCubbins,
28
29
30 1991). The initial idea of this thesis was largely based on the observations that
31
32
33
34 Congress rarely overrides regulatory decisions, and that legislators would have little
35
36
37 control over the actions taken by bureaucrats due to information asymmetries
38
39
40
41 (Niskanen, 1971). Yet a number of empirical analyses found the exact opposite. In
42
43
44
45 stark contrast with Lowi’s vision, they showed that legislators simply do not have to
46
47
48
49 override agencies, as agencies would already be doing exactly what legislators want
50
51
52 them to do (McCubbins, 2014). More precisely, a wide range of incentives put in place
53
54
55
56 by political principals to control and monitor the decision-making of federal regulators
57
58
59 or to oversee the enforcement of regulatory provisions was identified. These efforts
60

1
2
3 include both ex-ante and ex-post controls, such as “overt oversight of agencies”,
4
5
6 leading to “bureaucratic reactions to changing Congressional preferences” and
7
8
9
10 “sophisticated design of administrative procedures to control agencies” (Bawn, 1995).
11
12

13
14 The field was rapidly structured around the findings of seminal contributions, notably
15
16
17 McCubbins and Schwartz’s (1984) famous article on the “fire-alarm” system
18
19
20 established by Congress to enable interest groups to charge agencies with violating
21
22
23
24 Congressional goals, or Weingast and Moran’s (1983) influential work proving
25
26
27 systematic legislative influence over the Federal Trade Commission decisions.
28
29
30
31
32
33

34
35 Dating from the end of the 1980s, another series of contributions used a similar
36
37
38 framework to demonstrate that instead of having one political principal, bureaucrats
39
40
41 and regulatory agencies also need to cope with the Presidency – an institution proving
42
43
44 to be, as notably argued by Moe (1987), a more influential actor than the legislature in
45
46
47 this multiple-principal setting. Myopic and obsessed with the next election, members
48
49
50 of Congress would be unable to genuinely manipulate regulatory agencies beyond
51
52
53 mere position-taking and credit-claiming (Mayhew, 1975). This is not to say that their
54
55
56 influence is null. Yet the presidency as a unified institution would be more able to
57
58
59
60

1
2
3 impose its preferences on agencies, notably through executive orders (Moe & Howell,
4
5
6
7 1999). Without challenging the idea that regulatory behaviour in the US was in fact
8
9
10 heavily politicized, prominent studies thus argued that any omission of the Presidency
11
12
13 would face a high risk of overestimating Congressional influence, as notably
14
15
16 established in Lewis' classic study on Presidents and agency design, which covers
17
18
19 both regulatory and non-regulatory areas (Lewis, 2003).
20
21
22
23
24
25
26
27

28 Most, if not all of these contributions embrace a similar focus (a contractual approach
29
30
31 to political-regulatory relations), a similar orientation (driven by a strong interest for
32
33
34 hierarchical control) and common methodological approaches, anchored in the formal
35
36
37 or quantitative study of principal-agent relationships (Moe, 1984). A similar statement
38
39
40
41 also applies to the numerous contributions in economics (Laffont and Tirole, 1993) and
42
43
44 administrative law (for example Berry and Gersen, 2017) that examine similar or
45
46
47 related topics. In spite of undeniable controversies and internal debates, most also
48
49
50
51 picture the regulatory order in the US in a similar fashion, namely as being a political
52
53
54 product *by design*. A significant share of agency behaviour would accordingly result
55
56
57
58
59 from various manipulations undertaken by political principals – themselves responding
60

1
2
3 to various clientele groups and powerful coalitions of interests to ultimately ensure their
4
5
6
7 survival in political competition.
8
9

10
11
12
13
14 A review of more recent accounts reveals that this conception hardly changed over the
15
16
17 years. Thanks to better research techniques and methodologies, more accurate
18
19
20 studies have emerged without, however, substantially challenging the broader picture.
21
22

23
24 Political influence was notably shown to be conditional upon the legislature's internal
25
26
27 organization (Bawn, 1997); its resources (Huber and Shipan, 2009); anticipation of
28
29
30 other actors' likely actions, such as courts (McGrath, 2012); ideological orientation
31
32
33 (Meagher & Vander Wielen, 2012); the saliency and complexity of a policy area
34
35
36 (Ringquist et al., 2003); and a number of contextual factors, including the degree of
37
38
39 government unity (MacDonald & McGrath, 2016) or legislators' capacity to monitor
40
41
42 regulatory agencies cheaply (McGrath, 2012). A similar approach was also used on
43
44
45 the presidential systems of Latin America (for example Haggard & McCubbins, 1999),
46
47
48 the Japanese parliamentary system (Ramseyer & Rosenbluth, 1995), and a series of
49
50
51 international economic organizations (Hawkins et al., 2009). In most instances,
52
53
54
55
56
57
58
59
60

1
2
3 application of agency theory returned similar findings in support of the politicization
4
5
6
7 thesis.
8
9
10
11
12

13
14 The idea that politics ultimately drives a great degree of regulatory behaviour,
15
16
17 decisions and outcomes was therefore reinforced by many empirical illustrations.
18
19

20
21 However, and bluntly put, we think that there are good reasons to believe that many of
22
23
24 these contributions overestimate political influence. Clearly, we are not the first to raise
25
26
27 this concern – and it is precisely in American scholarship that objections to the
28
29
30 politicization thesis were first, and arguably most convincingly, raised. Carpenter
31
32
33 (2001), in particular, contended in his seminal study on the “forging” of bureaucratic
34
35
36
37
38 autonomy that most of the literature in public administration and on the politics of
39
40
41
42 regulation tends to undermine the role of regulatory action due to its excessive focus
43
44
45 on the initiatives taken by political principals to mitigate agency loss. According to
46
47
48
49 Carpenter, regulators, even in critical times, always possess real “capacities to
50
51
52
53 analyse, to create new programs, to solve problems, to plan” as well as “to administer”
54
55
56 (Carpenter, 2001). In a recent critique of the use of principal-agent models, Maggetti
57
58
59 and Papadopoulos (2018) more formally identified three sets of arguments supporting
60

1
2
3 the thesis of an overrated political influence in regulation. They first suggest that
4
5
6
7 politicians often lack the cognitive capacities to effectively monitor regulatory action;
8
9
10 second they argue that agency relations are always multidimensional, as both
11
12
13 politicians and regulators cultivate networks with various actors such as the media,
14
15
16 organized citizens, or even the public at large; third, they assert that regulatory actions
17
18
19 do not only happen within the *discretionary* range left by their contractual relations with
20
21
22 political principals because, when their *autonomy* increases, regulators are often able
23
24
25 to proactively alter the very parameters of the contract. These arguments connect with
26
27
28 those of several studies that refuse to draw a sharp line between purely political and
29
30
31 regulatory behaviors – as regulators are always able to shape policy and political
32
33
34 agendas, a point famously made by Huber in his study of the US Occupational Safety
35
36
37 and Health Administration (Huber, 2007). Eventually, politicians, too, might thus be
38
39
40
41
42
43
44
45 subject to regulatory influence.
46
47
48
49
50
51

52 Overall, these critics pushed towards a broader understanding of what constitutes the
53
54
55 politics of regulation beyond merely the influence of politicians – and perhaps, also,
56
57
58
59 beyond overt correlational evidence of agencies shifting their conduct in light of political
60

1
2
3 pressures. More recent research suggests that understanding regulatory agents
4
5
6 through this lens often leads to viewing political-regulatory relationships in a very
7
8
9
10 different manner. Regulators, in sum, respond to political signals, though not
11
12
13 necessarily from their political principals, and not necessarily at the expense of their
14
15
16
17 autonomy either.
18
19
20
21
22
23

24 In most of the literature that has emerged following Carpenter's initial arguments,
25
26
27 regulatory agencies were viewed as fundamentally acting to protect their moral,
28
29
30 technical, procedural or performative reputation (Carpenter & Krause, 2012).
31
32
33

34 Inherently multifaceted, an agency's reputation is maintained or enhanced in relation
35
36
37 to the many expectations of multiple audiences, posing various "reputational threats"
38
39
40 to an agency – but symmetrically constituting opportunities for an agency to advance
41
42
43 its reputation and ultimately, its autonomy (Maor, 2016). The Israeli banking regulator,
44
45
46 for instance, was shown to respond to public expressions of opinions only when they
47
48
49 relate to areas in which its reputation is weaker – and to remain silent when opinions
50
51
52 concern areas for which it already enjoys a strong reputation (Maor et al., 2013).
53
54
55
56
57
58
59 Reputational threats were found to shape the performance as well as the outputs of
60

1
2
3 Centrelink, an agency operating in the field of social policy in Australia (Maor &
4
5
6
7 Sulitzeanu-Kenan, 2016). In a similar vein, Krause and Douglas' (2005) comparative
8
9
10 study of the (presidential) Council of Economic Advisers and Office of Management
11
12
13 and Budget, part of the (Congressional) Budget Office, and of the (independent)
14
15
16
17 Federal Reserve revealed that resisting political pressures is more important for an
18
19
20
21 agency when its reputation is at stake.
22
23
24
25
26
27

28 **2.2 Questioning political dominance**

29
30
31
32
33

34 If scholars focusing on regulatory agents were able to draw a more complex picture
35
36
37
38 than those that only shed light on principals' action, their arguments received only a
39
40
41
42 limited echo in American scholarship. Part of the reason for this is disciplinary.
43
44
45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60
60

1
2
3 independence and political control” (McCubbins, 2014). More broadly, this relates to
4
5
6
7 the exact meaning of what one understands to be “political” in political-regulatory
8
9
10 relations, an issue we return to in the next section.
11
12
13
14
15
16

17 More fundamentally still, some real-world observations seem to justify this position.
18

19
20 The presidency of Donald J. Trump is a case in point, as it apparently brings a frank
21
22
23 refutation to the idea that the politicization of regulatory decisions would be
24
25
26
27 overestimated in the US. Having campaigned against the “deep state”, Donald J.
28
29
30
31 Trump indeed adopted a clear deregulatory stance, “using presidential powers
32
33
34 aggressively in pursuit of regulatory reforms” (Belton et al., 2017). And in effect, his
35
36
37
38 presidency has been ostensibly punctuated with a significant amount of measures and
39
40
41
42 initiatives aimed at refashioning the very practice of regulation in the country.
43
44

45 Appraising President Trump’s first three years in office, Sepulveda and De Lazari
46
47
48 (2019) found an impressive series of measures intended to shape behaviours,
49
50
51
52 decisions and outcomes of regulatory agencies: in 2017, President Trump issued the
53
54
55
56 so-called two-for-one executive order (E.O. 13771), which calls on agencies to
57
58
59 eliminate two existing rules for each new rule they intend to issue; in addition, it was
60

1
2
3 demanded that the cost of new regulations be strictly managed and controlled. Recent
4
5
6
7 figures suggest that the effects of this executive order were significant as, by the end
8
9
10 of 2018, agencies had already taken 243 deregulatory actions. In 2018, regulators also
11
12
13 received explicit instructions from the Office of Information and Regulatory Affairs
14
15
16 (OIRA) calling for a “net reduction in total incremental regulatory costs”. Trump’s
17
18
19 deregulatory agenda was pushed a step further in 2019, when the Office of
20
21
22 Management and Budget (OMB) imposed additional burdens on any new policies and
23
24
25 rules issued by agencies. Crucially, Congressional reviews are now required for any
26
27
28 major regulation or guidance. At the end of the same year, Trump issued a new
29
30
31 executive order (E.O. 13875) under which any state agency must terminate “at least
32
33
34 one-third of its current committees” (Sepulveda and De Lazari, 2019). These various
35
36
37 measures were paralleled with additional deregulatory initiatives in specific sectors
38
39
40 (typically in environmental protection, where more than 80 rules were removed or
41
42
43 planned to be so) and with an overall reduction in agency rule-making, according to
44
45
46
47
48
49
50
51 the most recent figures assembled by the Brookings Institution.²
52
53
54
55
56
57
58
59
60

1
2
3 Spectacular though it is, President Trump's relationship with the regulatory order does
4
5
6
7 not come as a surprise for most students of American politics. For several authors, it
8
9
10 is no more than an additional illustration of the propensity of political actors to shape
11
12
13 regulation to their own image, in order to serve the various groups from which they
14
15
16 received electoral or financial support. Milkis and Jacobs (2017) argue that "far from
17
18
19 deconstructing the administrative state" as promised, Trump has in fact embraced "the
20
21
22 levers of presidential discretion and power inherent within the modern executive office".
23
24
25 According to them, American political development came to a point where "political
26
27
28 contestation [...] is no longer a struggle over the size of the State; rather it is a struggle
29
30
31
32
33
34 between liberals and conservatives, to seize and deploy the State and its resources".
35
36
37
38 And indeed, while the presidential agenda eventually imposed deregulation in some
39
40
41 areas, others (which conspicuously include Veteran's Affairs and Homeland Security)
42
43
44 remained largely protected from it. In a similar vein, Lewis (2019) argues that although
45
46
47 different "in tone and tenor", Trump's "approach to regulation is consistent with the
48
49
50 actions of previous presidents", as it combines politicization of administrative
51
52
53 policymaking, a certain centralization of control and some reform plans. Lewis further
54
55
56
57
58 notices that Trump's actions find parallels with earlier Republican administrations, and
59
60

1
2
3 argues that it is essentially in his posture “as president but not as chief executive” that
4
5
6 he demarcates himself from his predecessors. According to Lewis’ figures, there is
7
8
9
10 more fundamental evidence of a deep erosion of the administrative state before the
11
12
13 Trump presidency – an erosion he largely attributes to a set of political and institutional
14
15
16 dynamics incentivising politicians to care more about programmes and regulations
17
18
19 than the structural framework through which the administrative state operates (Lewis,
20
21
22
23
24 2019).
25
26
27
28
29
30

31 While it is arguably too early to draw appropriate conclusions about the broader effects
32
33
34 of Trump’s administration on political-regulatory relations, some evidence does
35
36
37 suggest that this was not a one-way process – and thus that political influence could
38
39
40 once again be over-imputed. Four basic observations support this interpretation. First,
41
42
43 while the Trump administration was able, in its initial months in office, to repeal recently
44
45
46 promulgated regulations of the Obama era, empirical evidence shows that not every
47
48
49 recent regulation was deleted – and that organizational factors account for this finding
50
51
52 (Thrower, 2018). A second observation is that although Trump’s administration greatly
53
54
55 reduced the “flow” of new regulations, it “barely scratched the surface” of the “stock” of
56
57
58
59
60

1
2
3 existing ones (Dooling, 2019). A third observation is that much of the regulatory
4
5
6 cooperation with third parties (such as with the European Union) has proven resilient
7
8
9
10 to change in crucial sectors, particularly in financial regulation where the Covered
11
12
13 Agreement prepared by President Obama's administration was rapidly endorsed –
14
15
16 despite the fact it ostensibly sets additional regulatory burdens to the powerful
17
18
19 insurance industry (Zaring, 2019).
20
21
22
23
24
25
26
27

28 The fourth and arguably more profound observation is that strong political constraints
29
30
31 do not deprive regulators of their own agency.³ In other words, they are still capable of
32
33
34 resisting, curbing, or even enhancing their autonomy in the face of overt attempts to
35
36
37 align their decision-making with political preferences⁴ – investing precisely the various
38
39
40
41 reputational assets they possess. Environmental and pharmaceutical regulations are
42
43
44 two obvious cases in this respect, as both these politically salient domains have been
45
46
47 faced with explicit attacks from President Trump during his time in office.
48
49
50
51
52
53
54

55 A look back at their respective histories reveals that this situation is hardly new for
56
57
58 regulatory agencies in two areas, namely the Environmental Protection Agency (EPA)
59
60

1
2
3 and the Food and Drug Administration (FDA). In a recent monograph on the history of
4
5
6
7 the EPA, Demortain (2020) asserts that it is true that there has always been a strong
8
9
10 link between the agency's way of operating and the broader political context. Yet a
11
12
13 careful examination of major controversies (including the ozone standard, arsenic,
14
15
16 chemical substances or passive smoking) reveals that political pressures alone never
17
18
19 accounted for the agency's decisions. Crucially, over a period of time it was able to
20
21
22 cultivate an enduring network of actors (notably scientists) through which it managed
23
24
25 to establish its fundamental concepts, definitions of what constitutes an environmental
26
27
28 risk, a system for its measurement and communication – and thus influenced the
29
30
31 conceptual architecture in which the various audiences of environmental regulation
32
33
34 operate (Demortain, 2020). Carpenter (2010a) developed a similar argument in his
35
36
37 seminal study of the FDA. Granted, pharmaceutical regulation was repeatedly
38
39
40 politicized and faced with strong pressures from a wide range of powerful groups (from
41
42
43 patient advocates to the medical profession and the pharmaceutical industry). Yet the
44
45
46 FDA was able to impose itself as a pivotal actor in the field, precisely through the
47
48
49 intense scientific, political and bureaucratic work deployed by its agents over time in
50
51
52 various networks. It thus gradually established a strong and multifaceted reputation
53
54
55
56
57
58
59
60

1
2
3 that the regulator is now able to mobilize when faced with explicit attacks on its
4
5
6
7 autonomy. This independence is echoed in the agency behaviour under Trump's
8
9
10 presidency: to counter explicit presidential support for the pharmaceutical industry, for
11
12
13 instance, it published a list to "name and shame" pharmaceutical companies suspected
14
15
16 of purposely blocking competition from the industry producing generic medicines
17
18
19 (Yadin, 2019). During the current Covid-19 pandemic, it used expanded power to
20
21
22 maintain its reputation of a protector of the public, while trying to maintain its scientific
23
24
25 credibility in front of strong political demands – especially when it revoked emergency
26
27
28 authorization of chloroquine and hydroxychloroquine to treat the virus, while the
29
30
31 treatment was heavily promoted by President Trump.⁵
32
33
34
35
36
37
38
39
40

41
42 Combining a reflection on what political principals do to monitor their agents with a
43
44
45 reflection on what agents actually do in response and in a more systematic manner
46
47
48 could thus, it seems, generate a more accurate understanding of political-regulatory
49
50
51 relations in the US. To date, too few studies of American regulatory politics have
52
53
54 adopted such a broad perspective, which could offer a better understanding of the
55
56
57 interdependencies between those generic actors and the larger "forums" in which they
58
59
60

1
2
3 operate (Maggetti and Papadopoulos, 2018). More importantly in our view, this could
4
5
6 also help to connect the study of the politics of regulation to broader research
7
8
9
10 questions, such as the effect of political-regulatory interactions and (dis)alignments on
11
12
13 overall trust in regulators and regulatory outcomes (Carpenter, 2010b). Further
14
15
16 examining political-regulatory relations could also help, we think, to account for the
17
18
19 striking differences in terms of citizens' appreciation of the job done by regulatory
20
21
22 agencies and their variation over time.⁶ More fine-grained studies, as exemplified by
23
24
25
26
27
28 Carpenter (2010a) and Demortain (2020), could also examine how regulatory agents
29
30
31 influence – in turn – the perceptions of the regulated objects and their effect on political
32
33
34 principals. In sum, greater integration of the research focus could help understanding
35
36
37
38 the politics of regulation in the broader sense of the term.

45 **3. Regulatory Politics and the Power of the Agent**

46
47
48
49
50
51

52 **3.1 Dodging the principal?**

53
54
55
56
57
58
59
60

1
2
3 In a number of respects, the study of the politics of regulation has followed a different
4
5
6 path in European scholarship. Interest for the topic essentially emerged at the end of
7
8
9 the 1990s, at a time when most European countries (as well as the European Union
10
11
12 itself) were facing the development of a significant number of regulatory agencies
13
14
15 (Majone, 1996). Most of these entities were in fact former ministerial directorates or
16
17
18 industrial monopolies replaced with independent entities endowed with statutory
19
20
21 powers (Yeung, 2010). In most instances, these regulatory agencies did not have the
22
23
24 capacity to forge regulations with the same (important) legal status as their sister
25
26
27 agencies in the US. However, it became rapidly clear that their regulatory powers,
28
29
30 though different in shape, were considerable. In a variety of sectors (ranging from
31
32
33 environmental protection, transportation or healthcare to financial regulation),
34
35
36 independent regulators played a growing role through making important decisions, by
37
38
39 formulating guidelines that many sectoral actors are required to follow, and through
40
41
42 their effective participation in the policy process. More than their legal status, it is their
43
44
45 reliance on expertise and scientific 'gold standards' that effectively protect their
46
47
48 autonomy and are the main source of their power (see Maor, 2007). A rapid
49
50
51 burgeoning literature witnessed a profound transformation of the governance of
52
53
54
55
56
57
58
59
60

1
2
3 European capitalisms, where states became “increasingly preoccupied with the
4 regulation part of governance” as opposed to directly influencing economic activity
5
6
7 through unilateral actions (Braithwaite, 2011). Faced with the rapid development of
8
9
10 new organizations, structures and actors, many scholars identified the formation of a
11
12
13
14 “regulatory capitalism”, whose obvious expression – governance through regulation –
15
16
17
18 required dedicated and careful attention (Jordana & Levi-Faur, 2005).
19
20
21
22
23
24
25
26
27

28 Most of these pioneering authors were largely aware of the fact that forging regulatory
29
30
31 orders involves a strong political dimension. A first generation of studies in European
32
33
34 scholarship thus focused on the delegation stage through which regulatory agencies
35
36
37 and instruments were created (Thatcher & Stone Sweet, 2003). Comparing a selection
38
39
40
41 of regulatory agencies in Britain, France, Germany and Italy, Thatcher (2002)
42
43
44 emphasized the importance of contextual factors in the pressures faced by politicians
45
46
47 to delegate, including isomorphism; administrative traditions, structures and reforms;
48
49
50
51 and political leadership. Gilardi (2008) undertook an influential comparison of 17
52
53
54 European countries, in which he showed that governments are more prone to create
55
56
57
58 regulatory agencies when they need to increase the credibility of their regulatory
59
60

1
2
3 commitments and when they attempt to tie the hands of their successors. However,
4
5
6
7 most of these studies were not explicitly connected to a fully-formed theory of political
8
9
10 or partisan control. This was largely due to the fact that essentially the principal-agent
11
12
13 theory was used here in a much more metaphorical and flexible manner than in studies
14
15
16 of delegation in the US (see for example, Thatcher & Stone Sweet, 2002). Some core
17
18
19 assumptions of the original framework were often relaxed, and qualitative – instead of
20
21
22 quantitative and formalistic – approaches were most commonly used.
23
24
25
26
27
28
29
30

31 As in the case of American scholarship, some disciplinary dynamics also account for
32
33
34 this situation and for the subsequent evolutions of the field, which in Europe is
35
36
37 dominated by public policy and administration scholars, organizational sociologists and
38
39
40 legal scientists. Their typical research questions thus usually differed from
41
42
43
44 Americanists – and the focus of most studies in Europe has remained the structural
45
46
47 blocks of the regulatory state (namely agencies), not the larger political system in which
48
49
50 they are inserted. Some deep contextual factors were also at play here. Regulatory
51
52
53 agencies, both at the national and at the supranational levels, developed in line with a
54
55
56 series of governance doctrines in which autonomous expertise and the insulation of a
57
58
59
60

1
2
3 formal agency from political pressures were seen as key for their daily functioning.
4
5

6 Most of these doctrines in fact stemmed from core New Public Management principles
7
8

9
10 (see Hood & Scott, 1996). In the literature, questions of accountability and control were
11
12

13 thus often posed at the agency level, in order to determine some possible mismatches
14
15

16 between the general principles of good governance and how agencies actually operate
17
18

19
20 (see Busuioc, 2009). In the years following the initial wave of studies on the politics of
21
22

23 delegation, these disciplinary and contextual dynamics pushed the study of regulatory
24
25

26 agencies and regulation towards a different direction where regulators – not their
27
28

29 political principals – gradually became the focus of scholarly attention.
30
31
32
33
34
35
36
37

38 To a large extent, this still holds true today. Understanding regulation in European
39
40

41 scholarship often means understanding modes and types of regulation, as well as the
42
43

44 many and complex forms regulation takes in modern-day governance (Baldwin et al.,
45
46

47 2011). For the same reasons, it is the study of the relations between regulators and
48
49

50 regulated entities or third parties, such as the media (see Maggetti, 2012) that attracted
51
52

53 much of scholarly attention. Production and use of expertise by regulators, which
54
55

56 became central in regulatory governance for policy and legitimation purposes, also
57
58
59
60

1
2
3 imposed itself as a major area of study (see Schrefler, 2014 for a discussion).
4
5

6
7 Regulatory agencies were also examined through their involvement in the policy
8
9
10 process itself (Maggetti, 2009).
11
12
13
14
15
16

17 Political dynamics, seen as essential by American scholarship, thus seemingly do not
18
19
20
21 enjoy the same importance for Europeanists. Does that mean that the subject was
22
23
24 completely ignored? Not exactly. First, it is possible to find notable exceptions in the
25
26
27 literature, and it would therefore be wrong to say that the topic was completely ignored
28
29
30 in Europe (see for example Christensen & Lægreid, 2007). Second and more
31
32
33 fundamentally, an important body of scholarship on the “politics” of regulation in
34
35
36
37 Western Europe exists, but it conceptualizes and measures the political in a way that
38
39
40
41 is different to the approach typical of Americanists.
42
43
44
45
46
47
48

49 The study of regulatory implementation is an obvious case in point. This domain is
50
51
52 arguably one that has received greater attention in European scholarship, as well as
53
54
55 from a number of Americanists who come from the sociological and legal study of
56
57
58 regulation. Crucially, one can note that political factors clearly stand at the forefront of
59
60

1
2
3 scholarly interest in this domain, as recently shown by Short (2019) in her
4
5
6
7 comprehensive review of the literature on the politics of regulatory enforcement and
8
9
10 compliance. In particular, she identifies more than thirty different sources of political
11
12
13 influence in both (mostly US) quantitative and qualitative literatures, ordered in eight
14
15
16 broad categories (elected officials, government institutions, interest groups, economic
17
18
19 context, public opinion, political culture, sub-politics and individual politics).
20
21
22
23
24
25
26
27

28 Though not only focused on European scholarship, Short's study is informative for
29
30
31 understanding the implications of a distinctive European "way" in the field. Predominant
32
33
34 in the group of qualitative contributions are studies of European regulatory entities, or
35
36
37 empirical analyses authored by European scholars on Chinese or Latin American
38
39
40 regulations. Most, if not all of these contributions embrace a similar focus, as the
41
42
43 majority of them study the politics of regulation through "specific moments of
44
45
46 contestation by groups or individuals", sometimes shown as determined by "structural
47
48
49 factors like culture or ideology" (Short, 2019). Short also points out that they adopt a
50
51
52 broadly similar orientation, driven by a "multi-faceted" and often contingent
53
54
55
56
57
58
59 conceptualization of the political and how it affects regulatory outcomes. Contrary to
60

1
2
3 American political scientists and political economists, scholars thus do not derive the
4
5
6
7 contours of political-regulatory relations from formal hierarchies; in the same vein, they
8
9
10 do not see political influence as being a narrow form of control exerted by politicians
11
12
13 over regulators; and, methodologically, they often draw inferences from qualitative or
14
15
16 mixed-method approaches. A variety of regulatory settings are also subject to study –
17
18
19
20 and in this sphere there is more research on regulatory areas other than those
21
22
23 delegated to specific agencies. In a study of governmental influence on environmental
24
25
26 law enforcement in China, for example, Van Rooij et al. (2012) show, on the basis of
27
28
29 interview and survey data, the increasing influence of societal forces on regulatory
30
31
32 implementation. Using about 50 interviews on the regulation of industrial risks in
33
34
35 France, Etienne (2015) challenges the dominant view according to which a regulator's
36
37
38 resources and information asymmetries would be instrumental in detecting the politics
39
40
41 of non-compliant behaviour. Among other factors, he notably identifies an overall
42
43
44 concern for "reputational risks" as key for a regulator's motives and behaviour.
45
46
47
48
49
50
51
52
53
54
55

56 In these works, politics in its most common and obvious appearances (executive
57
58
59 leaders, elected officials, party politicians and political organizations) is not assumed
60

1
2
3 to be non-existent in regulatory environments. Yet it is typically viewed as not having
4
5
6 the capacity to fully control their internal dynamics and interactions. These studies thus
7
8
9 present a fair deal of similarities with those informed by the reputational approach in
10
11
12
13 American scholarship – except, perhaps, that they are widespread and predominant in
14
15
16 Europe, and arguably less so in the study of US regulatory politics.
17
18
19
20
21
22
23

24 An ever more pronounced departure from principal-agent and quantitative approaches
25
26
27 can be noticed quite recently in European scholarship, where significant theoretical
28
29
30 efforts have been made to further demarcate the study of the politics of regulation from
31
32
33 early American accounts. In two influential articles, Busuioc and Lodge (2016; 2017)
34
35
36
37 have offered a sharp critique of the principal-agent framework, formalizing the
38
39
40 arguments made by Carpenter (2001; 2010a) and a number of Europeanists. In their
41
42
43 first article, they notably argue that a hierarchical, vertical conception of political control
44
45
46 is misleading, as in most instances politicians do not seek to mitigate the loss resulting
47
48
49 from delegation to their agents (Busuioc & Lodge, 2016). In fact, this would rarely be
50
51
52 at stake in accountability relations, as both agents and principals always operate in a
53
54
55 larger network of actors from which they draw their legitimacy. Thus, accountability is
56
57
58
59
60

1
2
3 more clearly “about managing and cultivating one's reputation vis-à-vis different
4
5
6 audiences” (Busuioc & Lodge, 2016). Busuioc and Lodge further extended these
7
8
9
10 assumptions in a second article, in which they seek to explain the significant variations
11
12
13 in “organizational interest, intensity, and investment in accountability relationships”
14
15
16 (Busuioc & Lodge, 2017). Mapping different scenarios, they argue that the extent to
17
18
19 which the reputations of account-giver and account-holder are at stake, and whether
20
21
22 both (or neither) simultaneously face reputational concerns, explain the form and the
23
24
25 intensity of accountability relations.
26
27
28
29
30
31
32
33

34 **3.2 Accounting for political influence in regulation: legislative involvement in agency design** 35 36 37 38 **and termination** 39 40 41 42 43

44
45 The idea that one should adopt a broad conception of the politics of regulation is thus
46
47
48 well established in Europe. To be sure, it is certainly not a European peculiarity (see
49
50
51 Short, 2019) – even if it is arguably in European scholarship that the politics of
52
53
54 regulation was most systemically envisioned in its broadest sense (Baldwin et al.,
55
56
57
58 2010).
59
60

1
2
3
4
5
6
7 This posture is not solely a matter of epistemological or ontological orientation, as one
8
9
10 might expect. It is also based on some empirical evidence suggesting that the role of
11
12
13 political principals would not be as central in European regulatory orders as it is
14
15
16 elsewhere. Some fifteen years ago, Thatcher published a persuasive article in this
17
18
19 regard. On the basis of descriptive statistics, he showed that elected politicians in
20
21
22 France, Germany, Italy and in the United Kingdom were not using their powers to
23
24
25 appoint party politicians, to force the early departures of regulatory agency members,
26
27
28 to reverse their decisions, or to reduce their budgets and powers (Thatcher, 2005).
29
30
31
32
33
34 Others have found that formal independence of regulatory agencies in Western Europe
35
36
37 was an important determinant of actual independence, with independence measured
38
39
40 through political appointments of regulatory agencies' chief executives (Hanretty &
41
42
43 Koop, 2013). Overall, a recurrent observation has been that political principals
44
45
46 seemingly choose "not to hold their agents accountable" (Schillemans & Busuioc,
47
48
49
50
51
52 2015).
53
54
55
56
57
58
59
60

1
2
3 In our view, these solid and almost entirely converging results are nonetheless
4
5
6
7 questionable on at least two dimensions. The first is that they heavily focus on ex-post
8
9
10 controls, namely on the levers that politicians possess to monitor regulatory agencies
11
12
13 once they are created. Yet a largely shared finding in the US literature is that using
14
15
16 such mechanisms always comes with a certain, possibly high, cost for politicians – and
17
18
19 this due to their high visibility and because their utilization often requires substantial
20
21
22 information gathering on a given policy sector. In addition, it is doubtful whether
23
24
25 politicians might expect valuable benefits from these operations, as political
26
27
28 appointments or budgetary cuts can easily be reversed. Even in critical times (for
29
30
31 example, when an agency takes a controversial decision of high political importance)
32
33
34 research has established that the simultaneous involvement of multiple political actors
35
36
37 in regulatory decision-making creates obvious collective action problems (Gailmard,
38
39
40 2009) which a regulator might in turn easily exploit to curb or to mitigate the
41
42
43 consequences of these pressures.
44
45
46
47
48
49
50
51
52
53
54

55 More fundamentally, one can also note that studies concluding that political influence
56
57
58 in regulation in Europe is weak tend to adopt a similar, arguably problematic stance.
59
60

1
2
3 Indeed, their authors usually ignore politicians' actual interventions and test instead a
4
5
6 series of political variables at the agency level. For example, they report whether or
7
8
9
10 not an agency executive has political affiliation, or look at the share of resignations of
11
12
13 agency members before the end of their term. At best, political influence is indirectly
14
15
16 measured, typically by controlling for the presence of veto-players. Still, the motivations
17
18
19 and the actions effectively taken by political principals remain largely unobserved. In
20
21
22 this context, it is rather unsurprising to note that Europeanists have drawn similar
23
24
25 conclusions to those of Theodore Lowi in late 1960s America – namely that political
26
27
28 actors are not so influential in regulation, as they apparently rarely turn against
29
30
31 regulators and their decisions. In the quasi-absence of studies that measure more
32
33
34 precisely what political principals really do (though see below), we thus have to admit
35
36
37 that we still do not know if this is because regulatory agencies have become a “third
38
39
40 force” in European politics (Thatcher, 2005) or because agencies are acting
41
42
43 consistently with their principals' preferences, and thus that such ex-post control is less
44
45
46 necessary (McCubbins, 2014).
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3
4 What are we able to observe when these pitfalls are remedied, namely when scholars
5
6
7 look at ex-ante controls and directly account for actual principal involvement? Over
8
9
10 the last few years, a range of studies have started to examine, more systematically
11
12
13 than before, political influence in regulation – and surprisingly they have found that
14
15
16 agency politicization was in fact greater in Western European politics than traditionally
17
18
19 assumed.
20
21
22
23
24
25
26
27

28 For instance, Benoît (2021) has recently examined legislative involvement in the
29
30
31 creation of 48 independent regulatory agencies in France, therefore examining a
32
33
34 moment of the policy process that is widely regarded in the US literature as crucial for
35
36
37 the subsequent monitoring of regulatory agencies – the moment when legislators are
38
39
40 able to design appropriate administrative procedures (McCubbins et al., 1987) and,
41
42
43 more fundamentally, to draft detailed legislation to limit agency discretion (Huber &
44
45
46 Shipan, 2009). The results were enlightening: legislative involvement was shown to be
47
48
49 substantial for all agencies included in the dataset, and this both in terms of tabled
50
51
52 amendments, size of plenary debates or increase of bill size. He also reported that
53
54
55 legislators were more involved in agency design when the government proposal has
56
57
58
59
60

1
2
3 already granted them more powers to appoint members to an agency board, or to be
4
5
6 appointed as board members themselves. This suggests that political efforts to design
7
8
9
10 regulatory procedures and to manipulate agency discretion is important even for the
11
12
13 case of a legislature portrayed as weak (see Kerrouche, 2006 for a discussion) and in
14
15
16 a country that is widely regarded as a 'latecomer' in the adoption of new public
17
18
19
20 management reforms (Bezes, 2008).
21
22
23
24
25
26
27

28 There is in fact a burgeoning literature which, by directly measuring political influence,
29
30
31 shows that politicians are quite substantially involved in regulatory politics. Using
32
33
34 survival models for United Kingdom agencies, James et al. (2015) have shown that
35
36
37 "politics was trumping agency survival", even in a parliamentary country where political
38
39
40 influence was traditionally deemed weaker. Extending these findings, Holmgren (2018)
41
42
43 has shown that in the case of Sweden the risk of agency termination significantly
44
45
46 increases, following partisan shifts in government. Interestingly however, Greasley and
47
48
49 Hanretty (2016) have found for the UK that agencies 'intended to generate credible
50
51
52 commitments in regulation were less likely to be terminated'.
53
54
55
56
57
58
59
60

1
2
3
4 In a similar vein, other studies have sought to provide more accurate measures of ex-
5
6
7 post control, typically by adopting subtler research designs and techniques and by
8
9
10 trying to rely on more exhaustive databases. Their findings are often convergent, even
11
12
13 for this particular dimension of political influence or intervention, deemed as costlier for
14
15
16 individual politicians. Fernández-i-Marín et al. (2016) have for instance shown for the
17
18
19 case of Spain that board members of regulatory agencies who have an administrative
20
21
22 profile were more vulnerable to political changes than those with political ties.
23
24
25 Comparing independent regulatory agencies in 16 European countries, Enner-
26
27
28 Jedenastik (2016a) found that individuals with ties to a government party were more
29
30
31 likely to be appointed to an agency's head as formal agency independence increases
32
33
34 – typically in domains where agencies enjoy greater regulatory powers, often very
35
36
37 similar to regulation-making agencies in the US. Pérez-Durán (2019) recently
38
39
40 demonstrated that at the supranational level, the European Parliament, was more likely
41
42
43 than the Commission to appoint individuals having career ties to politicians.
44
45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

What these preliminary results more fundamentally suggest is that the politicization of regulators and regulatory agencies is not a peculiarity of the separation-of-power

1
2
3 systems of North and Latin America, on which much of scholarly attention has for now
4
5
6 concentrated. It is interesting to note however that a greater focus on the politicization
7
8
9 of regulatory agencies in Western Europe could well reveal a different kind of politics
10
11
12 than traditionally examined by Americanists.⁷ Indeed, and in the more fluid and
13
14
15 dynamic multi-party systems of continental European democracies, ideology – rather
16
17
18 than pure signalling, position-taking and struggles between governmental branches –
19
20
21 could play a more substantive role. This could also prove true in parliamentary systems
22
23
24 more generally (as many European polities are), in which “it is very difficult for any
25
26
27 incumbent coalition to credibly pre-commit the governmental apparatus to a course of
28
29
30 action that cannot be completely overturned at the next election” – thus reducing the
31
32
33 effect of any attempts at insulating regulatory agencies and provisions from a change
34
35
36 of government (James et al., 2015). In addition, and as suggested by James et al.,
37
38
39 shifts in the balance of power within parties (typically between antagonist ideological
40
41
42 factions) might substantially alter policy emphasis, and thus political attempts to
43
44
45 manipulate regulatory agencies and instruments (for a discussion of the implications
46
47
48 of parties’ ideological complexion, policy emphasis, and perceived issue competence
49
50
51 in regulatory agency creation, see Ennser-Jedenastik, 2016b).

just the impact of the political system, which is not the case.

It would seem that we have yet to discover the extent of political influence in European regulatory environments. To be sure, our argument is not that paying greater attention to the role of political institutions will generate a substantially different picture of political-regulatory relations as soundly, abundantly and convincingly depicted by many of the above-mentioned studies. It is also true that such efforts should be made without reproducing the pitfalls exhibited by some studies based on the principal-agent framework and rational-choice institutionalism as discussed in section 2 – studies that have often lost in sophisticated models of political control the importance (and often distinctive from an agency to another) of regulatory ‘routines, practices, concepts and technologies’ in administrative or regulatory behaviour (Carpenter, 2020). Yet political influence clearly constitutes part of the variation of regulatory behaviour that deserves more careful study – particularly as political involvement is perceptible when properly tested. In addition to offering a more complete understanding of well-documented features of regulation in Europe, the topic also appears particularly timely given the current state of European politics. Most regulatory entities in Europe are indeed operating in domains previously seen as positional issues (thus placed under the direct

1
2
3 control of politicians) that were delegated to independent regulators and experts during
4
5
6
7 the neoliberal era. Crucially, it clearly seems that the newly resurgent populism
8
9
10 apparently characterizing the condition of European democracies now constitutes (in
11
12
13 part) a rejection of expert and regulatory governance (see Hay & Benoît 2019; see also
14
15
16
17 Bertou & Caramani 2020a for a discussion). It is also for this reason that paying more
18
19
20 careful attention to the politics of regulation in Europe seems much needed – as it
21
22
23 touches upon the interdependence of the economic and the political spheres under
24
25
26
27 regulatory capitalism, an interdependence currently being challenged by a growing
28
29
30 number of adverse political forces.
31
32
33
34
35
36
37

38 **4. Conclusion**

39
40
41
42
43
44

45 This paper has sought to reveal and discuss the implications of a persisting divide
46
47
48 between Americanists and Europeanists in the study of the politics of regulation. We
49
50
51 have argued that the former face the risk of overestimating political influence in
52
53
54 regulation due to their excessive focus on principals and their narrow conception of the
55
56
57 political. Symmetrically, the latter could underestimate political influence in spite of (or
58
59
60

1
2
3 possibly due to) their broader conception of the politics of regulation – as they rarely
4
5
6
7 focus on what political principals actually do, while their involvement in regulation
8
9
10 seems significant when directly tested.
11
12
13

14
15
16
17 We concluded our discussions of each line of scholarship by drawing some basic
18
19
20 research agendas. More fundamentally, when considered jointly, they indicate that a
21
22
23
24 greater integration of these two lines of scholarship is desirable, particularly of their
25
26
27
28 research focuses and questions. This seems particularly necessary in a context where
29
30
31
32 regulatory governance is now firmly established as the main form of political and public
33
34
35 intervention on economic activity –both in advanced liberal democracies and in other
36
37
38 regions of the world, particularly in Asia and Latin America.
39
40
41
42
43
44

45 For the same reasons, regulation, as already foreseen by Braithwaite et al. (2007), is
46
47
48 now at the very core of the current challenges faced by governments in many countries.
49
50
51

52 It literally mirrors the tension between persisting “demands for competent and
53
54
55 responsible policymaking, in combination with the simultaneous populist resistance to
56
57
58
59 experts” (Bertsou & Caramani, 2020b). Whatever their preferred research interests,
60

1
2
3 conceptual orientations and methodologies, regulation scholars must pursue their
4
5
6
7 efforts to understand the very rationale and implications of the politics of regulation as,
8
9
10 perhaps more than ever, arguably its study constitutes a key standpoint to address the
11
12
13
14 issues openly and comprehensively.

19 **Notes**

20
21
22 ¹ The literature on regulation is vast, and many contributions other than those
23
24
25 presented here might rightly have been included in our discussion. See Chang
26
27
28 (1997) for a reflection on the politics and economics of regulation with a broader
29
30
31 historical perspective. For an examination on the politics of regulation less focused
32
33
34 on regulatory agencies than the present one, see Short's (2019) review on regulatory
35
36
37 compliance. Interestingly though, other reviews with a similar (though not an
38
39
40 identical) focus have reported fault lines close to those on which this paper largely
41
42
43
44
45
46 builds. This is notably the case in Carrigan & Coglionese (2011), who were the first,
47
48
49 to our knowledge, to explicitly characterize the tension between a neo-institutionalist
50
51
52
53 and a new governance approach in the study of the politics of regulation – without
54
55
56
57
58
59
60

1
2
3
4
5 characterizing however the largely geographical distribution of studies informed by
6
7
8 these two respective conceptualizations.

19

20
21
22 ³ Qualitative methods are certainly not the only way of establishing this claim. Using
23
24
25 formal models, Schinkel et al. (2020) have shown that even when faced with heavy
26
27
28 budgetary cuts or constraints, regulators may decide to pursue different tasks.
29

30
31
32 Notably, they may either focus on major cases with an uncertain outcome or on
33
34
35 minor cases with a higher probability of success, depending on the public image the
36
37
38 head of the agency wants to promote.
39

40
41
42 ⁴ Correa et al. (2019) develop a related argument on Brazil, showing strong
43
44
45 regulatory resilience in the country in spite of a range of political interference by
46
47
48 powerful presidents.
